

MNSDrone™

Rapid, Life-Saving Notification

When an emergency arises, communicating with people is a critical part of the overall action plan.

Notifying people in large remote areas has been difficult, if not impossible – ***until now.***

Large speaker arrays are limited in coverage (2-3 mile maximum) and may not always be near the emergency. Poles or structures used for mounting may be impacted by the disaster itself, destroying communication.

MNSDrone™ is an airborne Mass Notification Emergency Communication system that allows one operator to maneuver the drone and send messages.

Using patented technology by Hyperspike®, messages are clear and can be heard over ambient noise.

AUDIO FEATURES

- 134db Peak Output
- Long Range – 10 Miles
- Highly Intelligible Voice
- Rapid Custom Messaging
- Long Run Times

Using Mission Planner Software™, the operator plots the route, and the MNSDrone follows that route to deliver messages, returning to base when the mission is complete.
